Why does the Unhide Column shortcut key doesn't work:

Many Windows Vista and Windows 7 users have reported that the shortcut key for un-hiding the hidden columns doesn't work on their systems.

Let's understand why this happens. Microsoft Windows Vista and Windows 7 operating systems have assigned the 'CTRL+SHIFT' keys for Regional/ Language settings for changing the keyboard layouts. This functionality probably assigns numbers to different layouts.

So, the root of this problem is that whenever you press the column un-hiding shortcut key your OS gulps the keys and hence it interferes with the functionality of Microsoft Excel.

How to resolve this issue:

The resolution of this issue is pretty obvious and that is changing the Keyboard Layout shortcut. Follow the below steps:

1. First open the 'Control Panel', navigate to the 'Change keyboards or other input methods' link.
2. Now a 'Region and Language' dialog box opens, select the 'Keyboard and Language' Tab and click on the 'Change Keyboard' button.
3. Next, a new window 'Text Services and Input Languages' opens, here select the 'Advance Key Settings' tab and then click the 'Change Key Sequence' button.
4. Under 'Switch Keyboard Layout', set the radio button to Not Assigned (or one of the other options, if you need this feature to be available).
5. Click the 'Ok' button and now the unhide column shortcut key will start working in Excel.

This resolution is suggested in the [Microsoft Knowledge Base article.](#)

3. Unhide Columns in Excel using a Macro:

If you want to unhide your spreadsheet columns by using a code then you can use the following macro for this task:

[view plaincopy to clipboardprint?](#)

```
1. Sub Unhide_AllColumns()  
2. ActiveSheet.Cells.EntireColumn.Hidden = False  
3. End Sub
```

This small macro will unhide all the hidden columns in your active worksheet. If you also want this macro to unhide all the rows as well then simply add a line:

[view plaincopy to clipboardprint?](#)

```
1. ActiveSheet.Cells.EntireRow.Hidden = False
```

So, these are some of the ways to Unhide Columns in Excel. Do share if you know any other ways to do the same.
